# BROWSE CHOOSE APPLY

## Explore the entire European lightsources landscape

Stemming from the FP7 CALIPSO project, *wayforlight* allows you to view all the European lightsources at a glance. In a few easy steps you can get a complete catalogue of facilities, their beamlines and inspiring stories on their use.

## Select the beamlines for your experiments

Take advantage of the technical datasheets provided by the *wayforlight* catalogue to compare and select between more than 300 European beamlines. Use the full set of interactive filters to continuously refine your search and select the best beamline for your experiment.

## Fill in one form to apply for all beamlines

Applying for beamtime has never been easier. Fill in a single Standardized Proposal Form and submit it to the facilities that meet your needs. Follow the simple *wayforlight* online procedure and finalize your proposal at facility websites.

## find your beamlines

## *...and discover their light*

*Wayforlight* offers a beamline search tool with interactive filters as well as a freetext search option. The powerful search engine features different levels of filters that range from selecting experimental technique and type of facility to specifying the desired values for parameters such as photon energy and polarization, sample size, measurement temperature, etc.
The standardized beamline datasheets contain photon source characteristics, instrumentation and endstation description, local contact information.

## write your standardized proposal

The Standardized Proposal Form created on *wayforlight* includes 3 sections A) General B) Scientific C) Technical, is facility-independent and fully portable among European facilities. Upon filling the *wayforlight* form, an XML/PDF output is generated. The proposal is finalized by uploading this file to the chosen facility website.
Warning: wayforlight does not save any proposal data; all files have to be saved on local computer.
For some facilities, the Umbrella single-sign-on service is also available.

## *easy-to-use and faster interface*
